North Carolina State University

Pradeep K. Murukannaiah: Short Bio

Education

- ▶ PhD candidate in Computer Science, NCSU 2010–Present
- ▶ MS in Computer Science, NCSU 2011
- ▶ BE in Information Science and Engineering, UVCE 2005

Work Experience

- ▶ Intern, Google Summer 2011
- ▶ Intern, Duke University Summer 2009
- ▶ Software Engineer, Alcatel-Lucent 2005–2008

Professional Service

- ▶ Information Director, ACM ToIT 2013–Present
- ▶ Reviewer: EMSE, ACM TIST, ACM TSC, IEEE IC
- ▶ PC: IEEE MS, AAAI, Social Computing@AAMAS

Outline

Introduction

Bridging Data and Intent (AAMAS 2014)

Machine Learning from IoT Data (TOSEM 2015)

Supporting Decentralized Computation (TOSEM 2015)

Exploiting Human Intelligence (RE 2015)

Directions (Ongoing)

Internet of Things (IoT): The next BIG challenge

Engineer applications to deliver a **personalized**, **context-specific**, and **privacy-preserving** experience on the *decentralized* IoT infrastructure

Infrastructure

Potential Applications

- ▶ Smart Homes: Automation, health, safety, entertainment
- ▶ Smart Cities: Energy, environment, transportation, defense

Engineering IoT Applications: Research Challenges

Software Engineering

- ▶ Formulate high-level abstractions to represent raw data, e.g., *context*, *trust*, and *norms*
- ▶ Incorporate those abstractions into software artifacts, e.g., requirements and design

Data Science

- ▶ Map raw sensor data to high-level abstractions of interest via *machine learning*
- ▶ Augment machine learning with *human computation* and *collective intelligence*

Directions (Ongoing)

The Disconnect between Data and Intent

Intelligent Ringer: An example IoT application

Automatically sets ringer modes for incoming calls

Why does Intelligent Ringer consume NFC, audio, and Facebook data?

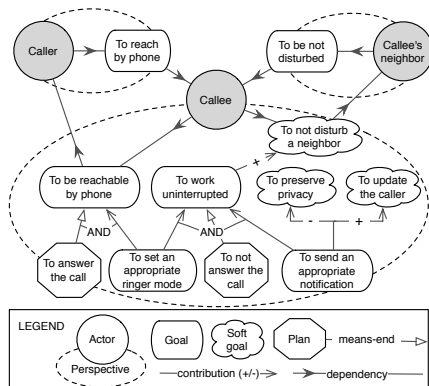

Modeling Intent

Tropos: An agent-oriented methodology

- Metamodel: Actor, goal, plan, belief, resource, and dependency
- Spans requirements, design, specification, and implementation phases

Intents and data are still disconnected

A Tropos model of Intelligent Ringer

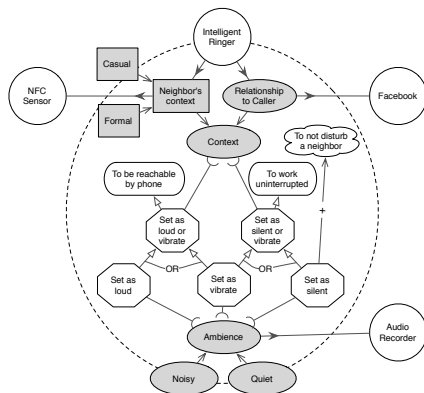

Bridging Data and Intent

Xipho: An extension of Tropos

- Provides systematic steps to map *agent capabilities* to *data abstractions*
- Yields a specification grounded in data, e.g.,
 $Relationship = ?R_1 \wedge$
 $Neighbor's\ context =$
 $Casual \wedge Ambience =$
 $Noisy \rightarrow Set\ as\ loud$

Intents and data are now connected

A Xipho model of Intelligent Ringer

Xipho: Empirical Evaluation

What benefits does Xipho offer compared to Tropos?

A developer study

- ▶ 46 students from a graduate-level computer science course modeled two applications each and comprehended a third
- ▶ Application requirements were specified as three–four use cases

Phase	Task	Group 1	Group 2	Group 3
1	Practice	Alarm	Motivator	Reminder
2	Modeling	Motivator	Reminder	Alarm
3	Verification	Reminder	Alarm	Motivator

Xipho Developer Study: Results

- Xipho significantly reduces **time** and **effort** required to model an application compared to Tropos

Xipho Developer Study: Results

- Xipho models of an application are significantly easier to **comprehend** than Tropos models of the application

$$\tilde{x}_X > \tilde{x}_C (p = 0.206)$$

$$\tilde{x}_X > \tilde{x}_C (p = 0.029^*)$$

Outline

Introduction

Bridging Data and Intent (AAMAS 2014)

Machine Learning from IoT Data (TOSEM 2015)

Supporting Decentralized Computation (TOSEM 2015)

Exploiting Human Intelligence (RE 2015)

Directions (Ongoing)

Characteristics of IoT Data

- ▶ **Multimodal** and **sporadic**: Originating from multiple sensors
- ▶ **Sparse**: Sensing consumes energy

Stream of intermittent sensor data and place labels

Machine Learning from IoT Data

Unsupervised approaches

- ▶ Often require frequent sensing
- ▶ Do not capture subjective nuances

Supervised approaches

- ▶ Require several labels for each place to perform well

Platys: A middle ground solution

- ▶ Active learning seeks to reduce labeling effort
- ▶ Semi-supervised learning deals with infrequent sensor data

Active Learning: Intuition

- **Uncertainty sampling:** Ask the user about doubtful predictions

Stream of intermittent sensor data and place labels

Active learning enables intelligent place labeling

Semi-Supervised Learning: Intuition

► Self training: Learn from confident predictions

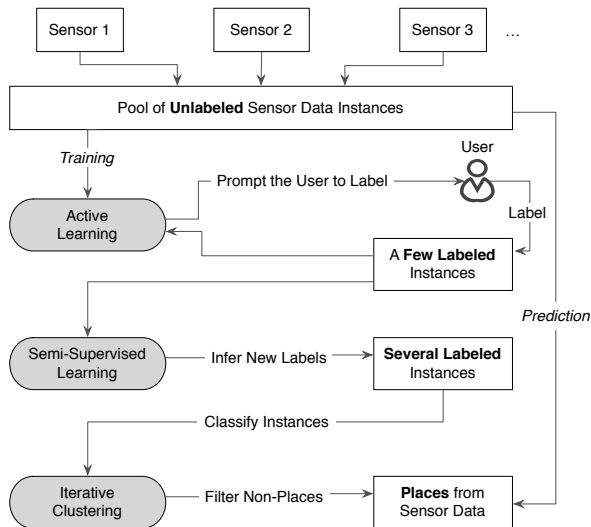

Stream of intermittent sensor data and place labels

Semi-supervised learning exploits latent structure

Platys: An ML Pipeline for IoT

Platys: Empirical Evaluation

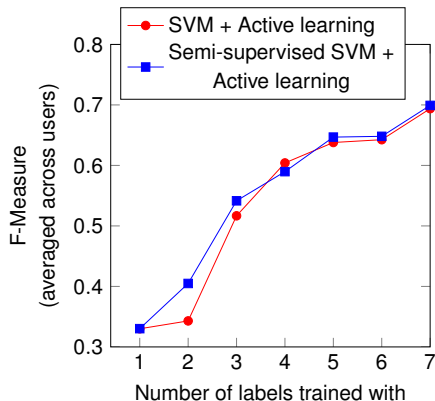

What benefits does Platys offer over traditional supervised and unsupervised ML approaches?

An end-user study

- ▶ 10 users employed an Android phone installed with Platys middleware as their primary phone for 10 weeks
- ▶ Platys middleware collected sensor readings
 - ▶ GPS, WiFi, Bluetooth sensor readings, and Google POI data
- ▶ Each user labeled places of his interest multiple times
- ▶ Compare Platys to two unsupervised and two supervised approaches after data collection

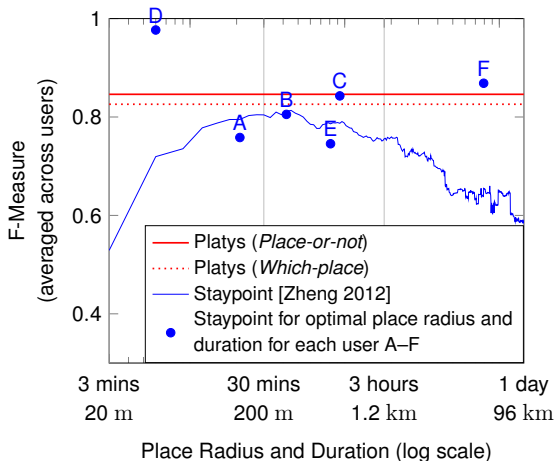

Platys User Study: Results

- ▶ Platys achieves better F-measure than two traditional classifiers
- ▶ Both active learning and semi-supervised learning add value

Platys User Study: Results

- ▶ Platys achieves better F-measure than two unsupervised approaches
- ▶ No single choice of place parameter values is optimal for each user

Outline

Introduction

Bridging Data and Intent (AAMAS 2014)

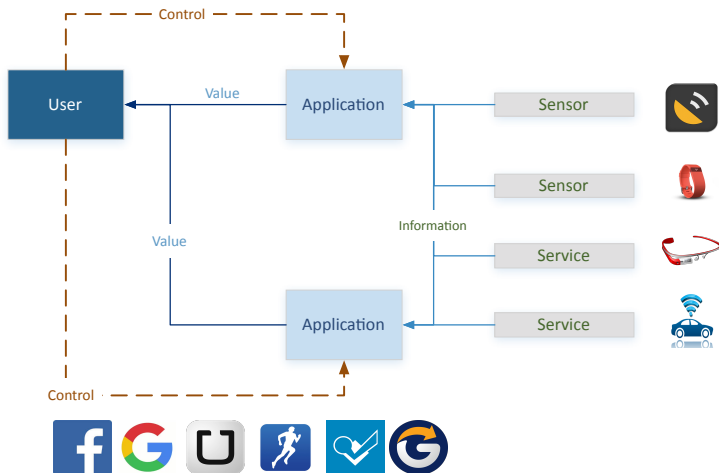

Machine Learning from IoT Data (TOSEM 2015)

Supporting Decentralized Computation (TOSEM 2015)

Exploiting Human Intelligence (RE 2015)

Directions (Ongoing)

IoT Applications: Current Setting

Current Setting: Shortcomings

Potential for privacy loss

- ▶ Users' personal data stored by several third-parties

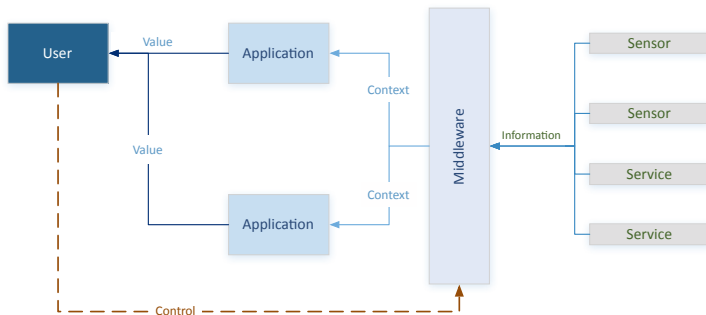

Fragmented user experience

- ▶ Each application may interpret users' data differently

Difficult to deliver a personalized experience

- ▶ Applications often rely on data aggregated from multiple users

IoT Applications: Proposed Setting

- ▶ The *middleware* maps raw sensor data into high-level *contexts* and shares contexts with applications, respecting user's privacy policies

Benefits of the Middleware Setting

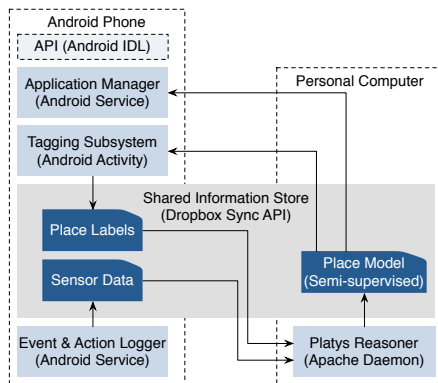

Potential benefits to an end user

- ▶ Uniform information architecture
 - ▶ Enhances learnability
- ▶ Simplified interaction design
 - ▶ Enhances ease of use
- ▶ Middleware-based service design
 - ▶ Preserves privacy

Potential benefits to a developer

- ▶ Separation of concerns
 - ▶ Simplifies development process
 - ▶ Yields modular implementations

Implementation

Platys Middleware: Empirical Evaluation

What benefits does Platys middleware offer over traditional setting to an IoT application developer?

A developer study

- ▶ 46 students from a graduate-level computer science course implemented the Intelligent Ringer application
- ▶ Functional requirements specified as three–four use cases
- ▶ Usability requirement specified as broad-brush guidelines

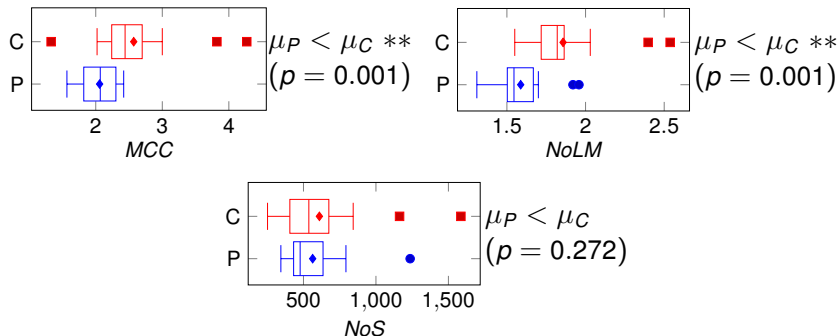

Platys Developer Study: Results

- Although developers employing Platys middleware spend more **time** in preparation, the extra effort pays off in later stages of implementation

Platys Developer Study: Results

- Applications implemented on the middleware setting are more **modular** than those implemented on the traditional setting

Exploiting Human Intelligence (RE 2015)

Directions (Ongoing)

Human Intelligence

- ▶ Humans are an integral part of the IoT
- ▶ No substitute for **human intelligence**, especially, for **creative** tasks

Can we systematically augment data analytics with human intelligence to accomplish creative tasks?

Resolve Goal Conflicts during Requirements Engineering

Intuition: Belief-based goal processing

- ▶ In order to activate, promote, drop, or suspend a goal, one has to provide or modify the appropriate beliefs [Castelfranchi and Paglieri, 2007]
- ▶ Elicit beliefs that support or oppose goals to resolve the conflict

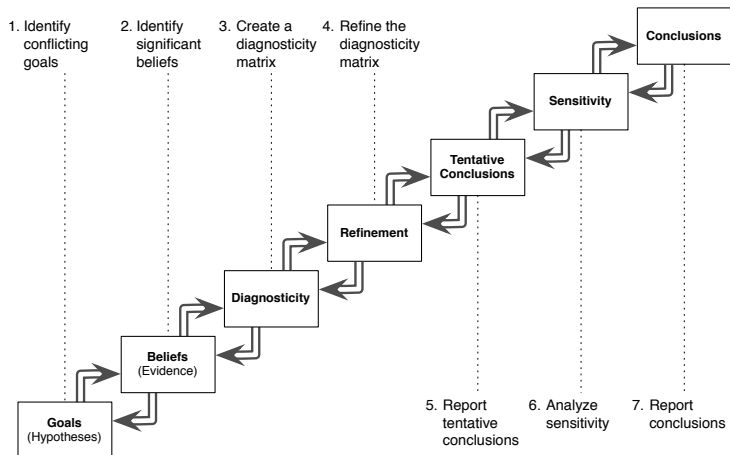

Method: Combine data analytics and human intelligence

- ▶ **Analytic method:** Analysis of Competing Hypotheses (ACH)
- ▶ **Human intelligence:** Argumentation

Analysis of Competing Hypotheses (ACH)

ACH is a tool to aid judgement on issues requiring careful weighing of alternatives [Heuer and Pherson, 2014]

ACH Solution to a Case Study

- ▶ The PARC ACH tool can be used to construct the **diagnosticity matrix** and analyze **sensitivity** of conclusions

File Edit Matrix Options Learning Aids Help

Enter Hypothesis Enter Evidence Sort Evidence By: **Diagnosticity** Type of Calculation: **Inconsistency Score**

Classification:

Project Title:
Enhancing security as per new budget

Available Matrices:
Main

E2 Evidence Link:

E2 Evidence Notes:

Type	H: 2 To enhance security at hotels	H: 1 To enhance security at train stations
	-1	-3
E2 British Intel suspects attack on hotels	C	II
E3 Trains were recently installed with security systems from the XYZ company	N	I
E1 US Intel suspects an attack on trains	I	C

Inconsistency Score ↕

Enter Evidence

Argumentation-Based ACH (Arg-ACH)

Operates under the rubric of ACH, but with the following exceptions

- ▶ Construct an *argument graph* instead of a diagnosticity matrix
- ▶ Employ a set of domain-specific and domain-independent *argumentation schemes* [Walton et al., 2008] as critical thinking aids
- ▶ Assign *belief* (B), *disbelief* (D), and *uncertainty* (U) scores to each argument, such that $B + D + U = 1$ [Jøsang et al., 2001]

Argumentation Schemes

An argumentation scheme is an inferential structure: a reusable pattern of reasoning. For example, consider the scheme below

Argument from expert opinion

Major premise E is an expert in a domain S containing a proposition A

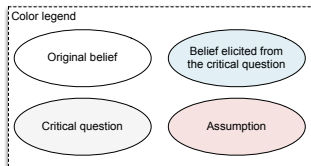

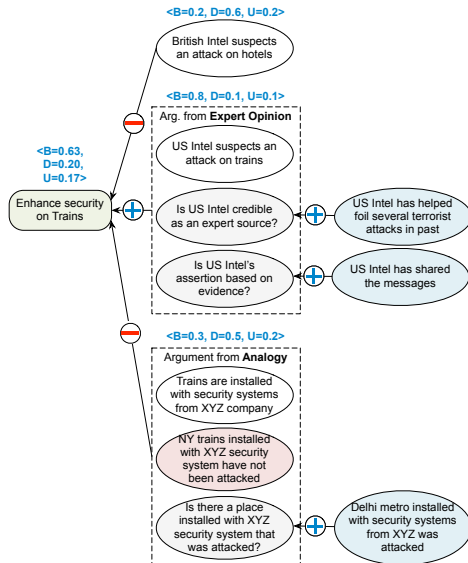

Minor premise E asserts that proposition A is true (false)

Conclusion A is true (false)

Critical questions

- ▶ What did E assert that implies A ?
- ▶ Is E 's assertion based on evidence?
- ▶ How credible is E as an expert?
- ▶ Is A consistent with what other experts assert?

Case Study: Arg-ACH Solution (Partial)

Arg-ACH: Empirical Evaluation

What benefits does Arg-ACH offer over ACH?

An end-user study

Subjects 20 (15 graduate and five undergraduate students)

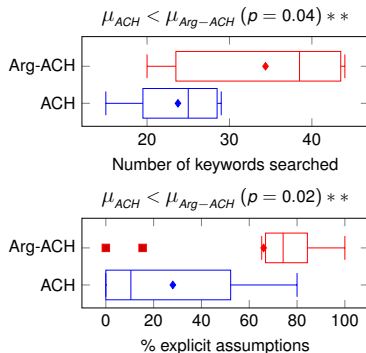

Task Resolve conflicts in the enhancing security scenario. Elicit the necessary beliefs by searching a belief database using keywords

Tools ACH subjects used the PARC ACH tool; Arg-ACH subjects used the Carneades editor [Gordon, 2014] for constructing the argument graphs

Arg-ACH User Study: Results

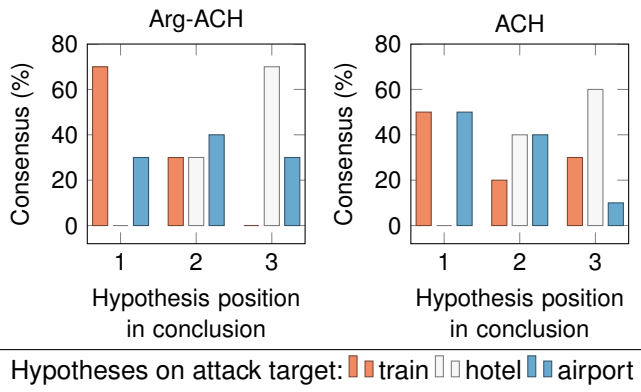

Arg-ACH analysts, compared to ACH analysts

- ▶ seek more **evidence** to resolve conflicts
- ▶ make more explicit **assumptions**, leaving an audit trail

Arg-ACH User Study: Results

- Arg-ACH leads more **consensus** among analysts' conclusion about a conflict compared to ACH

Directions (Ongoing)

Facilitating Crowd-RE

How can we elicit creative requirements from the crowd?

- **Data:** To be collected from MTurk
- **Methods:** Well-known, e.g., Delphi, genetic algorithm, personality and creativity surveys
- **Tool:** Developed

Collective Intelligence tool

The screenshot shows the 'COLLECTIVE INTELLIGENCE' web application. At the top, there's a navigation bar with 'Home' and a dropdown arrow. Below it, a breadcrumb trail reads 'Home > Game.'. The main content area is titled 'Requirements for an Alarm application' and contains the question: 'Imagine a next generation Alarm application for you smart phone. What features do you expect in that application?'. There's a 'Show' dropdown set to '10 entries' and a 'Search:' input field. Below this is a table of hypotheses:

Rate	Author	Hypotheses	Description	#Comments	Score
4	nirav	Adapt to traffic	The Alarm application should check traffic on route to my office and adjust (advance or postpone) the alarm accordingly	0	7
-	akkalia	Contact friend	In case I snooze multiple times ahead of an important meeting, the application should ask my nearest friend to wake me up	0	5
1	rpandit	Social	The Alarm application should post my alarm times to Facebook	0	2

At the bottom, it says 'Showing 1 to 3 of 3 entries' and has 'Previous' and 'Next' buttons. A '1' is highlighted in a box next to 'Next'. A blue button labeled 'CREATE A HYPOTHESIS' is at the bottom right.

Estimating Trust between Developers

How can we estimate trust between developers in an OSS project?

- **Data:** Available online, e.g., commit logs, and email interactions, and questions-and-answers
- **Method:** Developed [Kalia et al., 2015]

Trust antecedent framework

A CRF-based model
